CRISTIAN PEREZ LAGOS · 2026

Cover - 9 Years of Listening

Story signal Nine years of Spotify listening are framed as a personal behavioral dataset, not just a music recap.

Read The cover establishes scale immediately: hours listened, artist diversity, active days, and the 2017-2026 time horizon.

Listening Mix by Week Type

Listening Hours by Weekday

My Daily Rhythm

Story signal Listening is clearly workday-weighted, with the heaviest activity concentrated from morning into afternoon.

Read The heatmap and weekday bars turn timestamp data into a routine map: weekdays dominate, weekends behave differently.

My Listening DNA

- Story signal

Completion, skips, shuffle, and start reasons reveal how listening behavior changes beyond raw hours.
- Read

The artist scatter separates high-volume habits from high-completion favorites, while skip rate exposes time-of-day friction.

My Artists - Artist View

Story signal

Artist preference shifts over time, with 2025 concentrated around a smaller top cohort.

Read

The trend line and ranked bar work together: trajectory shows taste evolution, ranking shows who owns listening time now.

My Artists - Album View

Story signal Album listening highlights catalog depth: top artists are not only repeated, they span many albums.

Read The album view adds a second layer to the artist story by showing breadth of listening, not only total hours.

Platforms & Context

Story signal Platform behavior changed materially over time, with Windows and Android carrying most listening volume.

Read Device and platform views explain where listening happens, adding behavioral context to the music preferences.

Model & Measures Snapshot

Semantic model, measure organization, and DAX patterns

Modeling signal

Raw Spotify JSON is consolidated into `fact_streaming_history`, then descriptive attributes are split into dimensions for calendar, time, platforms, artists/tracks, episodes, and stream reasons.

Measure organization

All DAX lives in a dedicated formulas table, grouped by report page or analytical theme. Prefixes keep intent readable: REF for labels/text, # for counts, % for rates, and VIS HTML for custom visuals.

DAX patterns

Measures use CALCULATE for filter context, RANKX for top-N/ranking views, VAR/RETURN for readable logic, and DATEADD-style time intelligence for prior period and YoY comparisons.
